

Stop Your Addiction To Sugar and Reduce The Risk of Autoimmune Disease

Wendie Trubow, MD, MBA, IFMCP
with **Jonathan Landsman**

Wendie Trubow, MD, MBA, IFMCP

Hello and welcome to this episode of the Environmental Toxicants Autoimmunity and Chronic Diseases Summit. I'm Dr. Wendie Trubow and I will be your host today. I know I say this every time, but I'm super excited to be interviewing Jonathan Landsman today. He has been in the health and fitness industry for over 35 years and is the host of naturalhealth365.com, which offers a free newsletter, podcasts and videos that reveal the very best information in science and Natural Health solutions throughout his career, Jonathan has created over 500 online programs with over three of the three hun the brightest minds in natural health and science. He's the creator of six best selling online educational programs including the Stop Cancer and fatty liver Doctor class. And today we're gonna talking all about ways to improve liver and kidney health and also really ditch the cravings for sugar. So, Jonathan, welcome. Thank you so much for being here.

Jonathan Landsman

Welcome. It's a pleasure to be here, Wendie. It's exciting. We've got good information for all those that are concerned about liver and kidney health so important and obviously all of this will be centered around Reducing that inner fire inside that inflammation. That really is at the core of why these organs shut down over time and cause so many problems.

Wendie Trubow, MD, MBA, IFMCP

Yeah, 100%. How did you get into this? I mean, would you wake up one day and said I'm going to become an expert in the liver and the kidneys? Like what happened?

Jonathan Landsman

No, absolutely not. I was very athletic as a child. My father, a blessed memory was a great teacher, always enjoyed teaching Big influence in my life. So I spent a lot of time with him. And another thing that he loved was athletics, played, handball, took me to a lot of health clubs throughout the United States and mostly around the New York area. And I'll never forget, I tell

the story all the time when I was 17 years old, I just looked around as I was thinking, what am I going to do with the rest of my life? And I was so into athletics on a personal level, how much it was doing for me and feeling so good. I said, how can I, how can I do this for more people? That's what I wanna do. I was standing in a health club and I was saying, I'm going to be able to help a lot of people with health and fitness. So you can say it was a vision. But just back then, I remember it hitting me really hard that this is what I wanted to do. And actually, you know, I had to tell my parents, I want to walk away from a family business that they were doing has nothing to do with health. And that was a big deal for me at 17 to say I didn't want to continue on in that business. And so fast forward to now, almost 58 years old. Here I am today doing it.

Wendie Trubow, MD, MBA, IFMCP

I mean, to be a fly on the wall when you have that conversation with your parents, like I'm walking away from this. It's quite a moment,

Jonathan Landsman

You know, but it was, it was good. They were very cool about it. I mean, it was a bigger deal for me thinking that, oh my God, what will they think? But it was actually really good and I never looked back studying, you know, exercise, science, health and physical fitness, running health clubs, doing a lot of brick and mortar stuff and being in every aspect of health and fitness and coaching and private coaching and high, high performance athletic training. I was doing, I had a lot of very affluent clients who are asking me to help them with their fitness needs. So all these things were going over time and now it's full time. I'm doing this on the internet now through the programs in the site that you mentioned.

Wendie Trubow, MD, MBA, IFMCP

So how long did it take you to transition from bricks and mortar type of behavior to fully online. Like was that an easy process for you? Was that challenging? What happened?

Jonathan Landsman

The whole process has been challenging? And yeah, I mean, it was from now it's, I don't know, over 15 years of a process. Thanks to my beautiful wife saying to me when I was in the middle of taking care of so many things in brick and mortar and seeing, you know, literally hundreds and hundreds of people every single day, going to the club scene and talking to people about all the health and fitness needs and being so busy from 67 in the morning till you know, early evening, every single day. She's saying we got to get a website. So it's just learning all of those things about HTML code and how to do audio interviews, things like this that were just archaic at the beginning. But it was all challenges. But certainly, if I can use the cliché of labor of love, my wife and I are both passionate about helping others in this space. And so we just kept, you know, chugging away every single day learning and making a ton of mistakes. Lots of frustration, lots of challenges on the liver and the kidney, right? You're afraid of things, you're upset over things and, but just a matter of, you know, what we're going to talk about today is dealing with things in

a, in a much better way that just helped, helped us to improve every step of the way. And so. I wouldn't have it any other way. All of the stress, all of the challenges have been an absolute blessing. And, you know, I'm very happy to be where I am today.

Wendie Trubow, MD, MBA, IFMCP

And I think you've really transitioned into that away from 1 to 1 into one too many. So you can make an even greater impact and contribution going back to the epiphany and the vision you had when you were 17. So you've really brought it full circle. So, I want to transition a little bit and talk about something that I call the devil and be devil's a lot of people, which is sugar because it's everywhere. And I think people have a lot of difficulty staying away from it. And I as a clinician see the impact that it has and you also see the impact it has. So can you talk about first off? Why is sugar so bad? I know it's not just in a nutshell but like sort of broadly what goes on.

Jonathan Landsman

Well, you took away the words because I was gonna say in a nutshell, it really is the most simple, direct way of putting it sugar in excess is gonna absolutely cause too much of that chronic inflammation in the body. So if you speak to anybody in the world, they're going to easily be able to admit. Oh Yeah. Yeah. Inflammation is not good for the body, cellular breakdown, right? The cellular wall breaks down, things don't work as well. Cells make our tissues, tissues make our organs, fatty liver is going to develop with too much sugar where it's artificial sweeteners. That's a whole other discussion but not good. And all the kinds of sugars that are out there. This is just very destructive on ourselves and our organ tissue. And so this is the kind of thing I think that people need to just be told more because conventionally speaking, Nobody's really talking about it that much. You know, if you hear it all the time everywhere you go is that people are talking about, well, I shouldn't have that thing. I shouldn't be eating this but then they eat it anyway. Why is that?

Wendie Trubow, MD, MBA, IFMCP

Yeah. So, I mean, humans are going to be human. So my first question is, is there some quantifiable amount or does this really change for every person or is it an all or nothing? zero sum game?

Jonathan Landsman

Yeah, I think it does matter on the person. Obviously, if they're more physically active, they may tend to get away with it more. I think any amount of sugar is something to watch out for. But if you're talking about a very, very healthy person in all ways that we mean healthy, emotionally, physically, mentally, you know, spiritually all of these things and there's no signs of illness at all is a little bit of sugar, a big deal. No, I think the nature of the sugar certainly has a lot to do with it. You hear a lot of people saying, oh, don't eat grains, grains are no good. I get that part of it but certainly brown rice and lentil beans, sugar, chickpeas and all of this. Do I think this is the scourge of the earth, as you say, you use the word the devil versus chocolate cake and brownies

and you know, cookies and even organic chips and pasta. Eating a lot of that food is really a no go I don't think that's good for anybody if that's the vast majority of what you eat. And I do believe that for a lot of people, they may not even admit or be aware of the fact that they are very sugar based in the way they're eating or they might say things like I did when I was younger. Oh, hey, it's organic. So it must be okay. And I don't mean the obvious organic sugar or white sugar. Obviously, any of that I think is just like you say, you're playing with the devil, right? So you have a little bit of that, like a little bit of cocaine and then you're gonna want more and more. So I think it's always about the nature of the sugar that you're eating and how much of it you're eating and also very much in relationship to your health status and how physically active if you are. I think all of that has a lot to do with it.

And also when you couple that with the amount of toxicity that is around you and within you in terms of where else you're getting toxins in your life. Because when all of that is there as well, a small amount of sugar presents itself as a much bigger problem for that person that's always feeling agitated, really filled with toxins, dealing with health problems. A little sugar in coffee could be a really big problem or even half a cup of blueberries for that really hypersensitive person who's a diabetic, it's got major blood pressure issues. You know, you're shifting your attention to a very different kind of person and say someone like me where not presenting any issues with blood pressure, not taking any medications at all.

You know, half a cup of blueberries. Certainly not as much of a problem as someone who's dealing with a lot of health issues. So I think it's always important to talk in context. I'm really very careful not to make blanket statements. But if I were to make one blanket statement, eating too much sugar is no good and sugar in general should be kept at a minimum and we can talk about some other tips that would help someone to get that under control because I don't think it's enough to be able to say to someone Hey, sugar is no good and cut it out, you know, stop eating so much.

Wendie Trubow, MD, MBA, IFMCP

No, no. I think we need to go a little bit deeper into that. But I think the first thing that you've really said, that's a tremendous pearl is that the quality of the food you're eating matters and the quality of what ultimately converts into sugar because everything gets ultimately broken down into sugar. So how hard is it to get it from its source to being sugar? And what did it start at when you put it in your mouth? So if it comes from a package, if it's processed, if it's straight up sugar, that's going to be intrinsically more inflammatory and alter the way that your body responds versus food based sources that are harder to break down, not processed. I mean, they're ultimately going to get to sugar. But again, the balance of them,

Jonathan Landsman

If we could stay on that topic, then that's perfect. So in the context of eating sugar, not that I would recommend this technique, but if you're eating chocolate cake and you chew it up really,

really well. Is that better than gulping it down? Yes. But going back to what you're saying about how you manage that sugar intake. Brown rice, which is filled with lots of natural fibers or an apple that has sugar or other kinds of fruits that you are chewing with fiber in it. Yes, of course. You know it's a, it's a different impact. But chewing in general is a lost art as well throughout the western world. So chewing is introducing more saliva and breaking down those sugars which are intended by our bodies design to be broken down with all the enzymes that get produced in the mouth. So if we are just and swallowing right away, it's like there is no chewing, there is no saliva and down the hatch it goes were festering in the stomach and that's not a good thing. So obviously, the quality of the sugar we eat, keeping it a minimum, making the quality as high as possible. Organic food in general is great. But that quality and chewing it up really well has a huge impact on our overall well being and keeping inflammation down.

Wendie Trubow, MD, MBA, IFMCP

I'm laughing as you say this, Jonathan because about a year ago, I was reading how the average number of chews is 3-4, chews before a human being swallows. And I thought okay. And then in our practice, we see a lot of people with digestive issues, bloating gas diarrhea, but really the bloating and the constipation and diarrhea and the GERD. And then I thought okay. Well, if you chew your food better, you have smaller particles that get into the stomach, smaller particles that then get into the small intestine.

So you're intrinsically setting up the the whole system to be better if you give your body smaller particles. So a year ago I took on, I'm gonna chew my food 25 times every time I put it in my mouth. Do you know how long it takes to eat a meal When you chew your food 25 times? I'm always the last human being at the dinner table chewing. But it makes a tremendous difference in digestion and experience and absorption. So the end result is much better. But, but its, if the right people around you aren't doing it, you're, it takes a much longer time to eat just for the record.

Jonathan Landsman

You're absolutely right. For the record. My studies and natural medicine started with the macrobiotic community and macrobiotics is very well known for helping a lot of people with cancer and all kinds of health issues. But I was in charge of running these large summer conferences and so everybody would come around for a week, they would stay away on a college campus. They eat three meals a day. There was a place for people to eat, but then there was this special place for people who want to chew their food, including the bowl of Soup 100 times in silent meditation. So you would go into a tent, I had my outdoors tent, your seating area, bench and tables. All that. You have a cup of soup, little miso soup, you know, a little tofu, a little wake, some soybean paste, the miso, right? All great quality stuff. You one soup and your one bowl of brown rice, took me one hour to do that every single day. And you are with lots of other people who wanted to experience that. That as well. Again, most people practically speaking, Wendie are not gonna chew that long. But there was something really valuable that came out of that.

That is so important for liver and kidney function, right? And that is this whole idea. All of this that we talk about is inflammation, too much inflammation and body, too much physical stress on the body. And we break down and when we physically are breaking down like this by making poor food, drink choices, lifestyle choices, which I know we talked off camera, you talked a lot about anger and fear. We can talk a little bit about that if you like. But making these poor choices when it comes to all of these things, sets the stage for us to always be feeling like, you know, in this sympathetic mode, not a parasympathetic nervous system state. When we are in a parasympathetic state, we are generally speaking calmer, we can manage things better inside of our body. Biochemically, let's just stick to that alone, but also obviously, emotionally, spiritually mentally, we're in a much better place to be able to deal with the stresses of our life.

And when you chew your food even 2030 times more than the two or three, it's gonna have a huge impact on your nervous system, all you have to do is really devote yourself to doing at one time and you will absolutely feel on a nervous system level, like everything has calmed down probably about 10 levels, especially compared to what most people are feeling. Those people out there who are not feeling well. This is a tremendously powerful the thing that people can do immediately, that cost nothing at all. Of course, eat the best organic quality food and don't be screaming and yelling before you eat and you know, surround yourself with good people when you have a meal. Yes. But if you just take more time to chew, it is amazingly settling and great for the entire body.

Wendie Trubow, MD, MBA, IFMCP

I love this. Now you just said something a few minutes ago that caught my attention because most people who want to eat less sugar, feel out of control. So you referenced making poor choices. And yes, ultimately, we are in the driver's seat and we make the choices. But I think a lot of people feel out of control around sugar like it has them, they don't have it, it has them and they need it. But you off camera talked about a way that people can interrupt these cravings and I was hoping you could talk about that because that's so powerful to be able to give people a tool for. Oh, you could actually interrupt this craving so that you can get through it and continue to eliminate decrease and, and avoid sugar.

Jonathan Landsman

So I think, yeah, sure. I think it's just a very simple strategy that everybody would benefit. Again. We don't like to make blanket general statements, but this one would definitely fall into that bucket as being a okay. And that would be too high hydrate more throughout the day. I think as a strategy, people need to drink more water and I think most people like, yeah, I don't really drink too much. I can't stand it. Spike it with a little lemon juice if you want. But another strategy is to greatly increase. And I say it that way because most people are grossly deficient in vitamin C intake. So if you just have vitamin C powder dissolved in water, you Wendie would not know that it's in this water glass. Most people won't. It's a little bit of a tart flavor. But so what? So now throughout the day, you're treating yourself with probably one of the best quote unquote I V

treatments that you could give yourself for basically very little cost and a huge impact on reducing your craving for that sugar. One, you're more well hydrated throughout the day. So say you take a glass eight ounces, 10 ounces and you put 23 4000 mg of vitamin C powder in there. Stir it up, drink it down over the course of, I don't know, 10, 15 minutes, a relatively short period of time down the hatch, it goes in the morning. Great. Now, late morning, early afternoon, late afternoon, early evening, at best, because of course, a few hours before you go to sleep, you don't want to be guzzling a lot of liquid.

Then you'll be waking up in the middle of the night and being well rested and getting a good night's sleep has a lot to do with our hormone balance and our ability to reduce our cravings for all kinds of unhealthy things. So we can get there in a moment if you like about sleep and sleep habit tips. But during the day, putting that vitamin C in your water and just upping your intake to a very basic level, although it sounds like it's radical to most people. What Linus Pauling was recommending for all people 6 to 10,000 mg of vitamin C every day for the average normal healthy person.

Wendie Trubow, MD, MBA, IFMCP

Does the form matter Jonathan?

Jonathan Landsman

Yeah. The form is not something I think we should get too hung up on now. Yes, liposomes is a bit more expensive. It does get into the cells more. You have a fat encapsulated vitamin C and sort of like a gel type of liquidy substance that you can take directly in your mouth, you know, with a teaspoon and then sip it down with some water. Liposomes is gonna get intracellular. You're gonna be it's gonna be easier to get in the cells. Vitamin C powder is going to interact with your digestive system. So all amounts capsules, I don't particularly like swallowing lots of pills and capsules. So a powdered form that you can dilute in water certainly is gonna be interacting with your digestive system and you're not going to absorb as much and it's gonna be more of an extra cellular vitamin C intake.

But the bottom line is instead of splitting these hairs, it's just to move that vitamin C intake up to at least 6 to 10,000 mg a day. That is completely reasonable for most people out there dealing with medications that they're taking the normal day to day, even if they're not taking drugs at all for any kind of health conditions, just the normal everyday stress that we're all dealing with in terms of life and five G, four G, all this EMF pollution that's around us and just these, you know, these relationship issues that we have to deal with day to day and the things that we have to get done, we are not producing enough vitamin C when our bodies are under stress, like most people, the most animals. And so this is the kind of thing that is essential and it has to be gotten from our diet. But diet alone these days, especially Wendie is not going to do it. And I think most people watching this Wendie they're dealing with some sort of health issue and if they're not dealing with the health issue they certainly know someone, their family, their friends who they

care about so deeply that is really struggling with health problems. They would greatly benefit the vitamin C. I'll just tell you one quick story of somebody that worked with me who again to be perfectly candid is not really so savvy about all of these things that all your experts are talking about here on your program. He didn't know anything much about vitamin C and he's been around my work and he's in our business, but he got hit with a illness that was really making him feel under the weather and he was struggling with it for a few days. I told him take some more vitamin C. Basically what I told you just up it, he went to a pharmacist to get some drugs for his symptoms, you know, cold stuffiness. And when they found out the pharmacist found out how much he was taking, which was several 1000 mg a day.

They said, oh, no, don't do that. 1000 mg a day. That's the most you should take. You could get kidney stones Wendie for anyone who's concerned about vitamin C. They really should refer themselves to the Reardon Clinic. This is the vitamin C capital of the United States. If not the world, I happen to know very well. The chief medical officer there, Dr. Ronald Hunting Hockey. He has personally supervised and overseen over a quarter million I V therapies. If you will sessions and in these sessions, the vast majority of these people are severely compromised in liver kidney function, dealing with massive issues with cancer, heart disease. These are not, you know, world class athletes and pristine health and all of them are taking starting off at 25 50,000, 100,000 more milligrams of vitamin C per day, no issues with kidney stones. This is a complete myth that is pushed by. Yeah, it is so pushed as fearmongering and conventional medicine with no good basis grounded in good science at all.

So I just hope people don't just believe what I'm saying. Look this up yourself, increase your vitamin C intake. You will not be sorry in terms of reducing inflammation throughout your body. It's wonderful to help support good liver function and kidney function, improve the quality of your blood in general. And it will absolutely reduce your craving for sugar. If you're just more well high rated with good quality clean water and you're taking in that vitamin C on a regular basis, don't expect this to change overnight, but over time, it absolutely will. And then yes, another pro tip. Let's just say the obvious is try to find those sugars like we said before, that are better quality. You know, do grapes have sugar? Can they spike your sugar, your sugar levels? Yes. Can a cup of blueberries spike your sugar levels? Hi. Yes, it can.

But if you're hooked on cakes and crackers and pretzels and cookies and donuts. And you're moving away from these things that have virtually no fiber to speak of at all. And the worst quality sugar and your next transition, which I certainly did when I was first starting this out, you know, changing over my diet 36 plus years ago, moving to these better quality sugars is great dried raisins instead of a chocolate chip cookie from the supermarket shelf. I mean, it's definitely a place to go. And then if you have these health issues, you certainly want to work with a health care provider, a health coach that understands these things to really just keep you going in the right direction. But your cravings will change. And just another quick story I had when I was in my macrobiotic days, I was a very black and white guy. My personality was, wow, this is amazing

information. I'm gonna just do this and I didn't have as much of a problem to just take it and run with it kind of thing. So I did that with macrobiotics. Really moved away from the fast food, eating the pizzas and the Taco Bells and all of that other world and moved into all this organic eating rice and sea vegetables and beans and miso soup and all of these wonderfully healthy natural organic foods. I went to a holiday time period and spent time with my mom and dad. A blessed memory when they were around and when they had tea at the end of dinner, my cup was switched with my father's cup. My father loved sugar. As soon as that tea cup touched my lips, I just spit it out immediately. Without even a thought.

That was an experience. I will never forget in terms of a self defense mechanism if you will. That blew my mind. How on earth did my body recognize sugar? Where I didn't even say, wow, this is so sweet. I have to put this down. Where is my cup? It was just an immediate reaction of repulsion and I didn't want it. So again, that was an extreme change for me in my diet for quite a long time and then visiting their home having that little bit of sugar. It was a very strong reaction is really freaky. But it's just to tell that story to give hope to people that your body, your biochemistry, your taste buds, your cravings absolutely can change. But you need to be consistent with your approach. And if you're not changing that craving, then you need to make some more changes.

And just be honest with yourself to keep going down the road until you get to the point where you are not controlled by these cravings to be perfectly clear, cravings for food that control you consume you. That is clearly a sign of poor health not to be judgmental to anyone out there. But that's absolutely a sign that something's going on. You can't fast for a long period of time. Say an entire day comfortably, I would underline comfortably being able to fast without feeling anger issues, frustration, extreme cravings and feeling out of control. That is a sign that your body still needs work in getting healthier and healthier. So I hope some of these things help people out there, Wendie.

Wendie Trubow, MD, MBA, IFMCP

Yeah, I think this is great Jonathan because one thing you're highlighting is I always say, you know, you're the way you eat is a spectrum and find yourself on the spectrum. And the goal would be just keep making improvement every day, every week, every month, every year, get better this year than we were last year. Make not better like a better person, but just do a better job. And so the thing that's so nice about what you're talking about is wherever you are. It's about. I always think someone is either a fell swoop kind of human where they're going to change everything about the way they eat or they're an incremental process one step at a time. So you first have to figure out like who are you and what works best in your life and your family in your house and what have you already purchased and you need to get rid of. But what's so nice about what you highlighted is you can substitute. It's not like you have to go from eating away that has a lot of processed food into one that's macrobiotic in one step. Necessarily what you want to do is walk on that spectrum and get better. Look to see what can you switch out.

Jonathan Landsman

I think also it's other practical things that I think people fail to do, which makes it difficult for them to avoid sugar is who you're hanging out with. Sometimes you can't control that but then maybe you can steer where you meet Jonathan. You don't understand. I go out, I have to go out. It's my social, I can't stay cooped up in my, my home, in my office. I need to do that. Okay. Great. So then go like my wife and I always seek out the best quality organic restaurants to at least get the best organic food and go there where you're gonna be tempted less. So be careful who you're surrounding yourself with. If you are being influenced greatly by people that are really, you know, giving you that opportunity to eat a lot of sugars, maybe you do have to change that up a bit as well. But again, it depends how serious somebody wants to take this. And one day I would say that obviously for a lot of people, I would imagine that are watching this. It's not like they're all in just such perfect health that they were.

Then what would be the point of, you know, listening to any of this lock on, keep doing what you're doing. But if you're in really serious health issues, you really don't have a lot of time, the faster you make these moves, the better you're going to feel sooner. And I think that's what this is all about. You do have to get tough with yourself, but it's in the best way possible. Don't make this seem like some sort of dreaded task that you have to do. Get excited about this and, and really keep in your mind that, hey, when I do this, I know I just have faith that there's going to be a much better life ahead of me. I think if those things are not there and it says, oh God, I'll just do this. All right, I'll give it a try. My, my wife wants me to do this. I'll go ahead and do it. You're probably not gonna stick with anything. We all understand.

Wendie Trubow, MD, MBA, IFMCP

No. You know, you also just reminded me of two things. One, if you're stressed, you're gonna be craving sugar because your body thinks you need to run from a saber tooth tiger. And if, if you need quick energy, you're gonna crave sugar. So one eat food when you're hungry as opposed to sugar. But the other thing I just forgot what I wanted to say. Wait. The other thing is don't go to parties hungry ever. And if I don't leave house without food, literally, I don't leave my house without at least two meals and we always get stopped in the airport because we have so much food there. Like, what are you worried about them? Like, I'm worried about a delay. I can't eat anything, like, guard your backside. Right?

Jonathan Landsman

Yeah. And don't go shopping when you're hungry as well. So all of these things have a lot to do with the way we think and we feel the way we think and feel has a lot to do with driving us to sugar. So that's a very important thing you're saying to. Yes, it's easy to just say, you know what? I got a great tip for you to cut down your sugar. Cravings don't be so stressed out. But that's actually that is the point. You should be taking more time in your day to figure out how I'm gonna be my best gatekeeper. You know, I use a work management flow software, Wendie, not

to get too far, far off topic. But I'll lay out my day what I feel I can accomplish if something has come up that has really captured my attention and has really taken a lot of my time and I'm gonna get so stressed out about the other things I haven't accomplished. No, no, no, no, no way. Take those items, put them to tomorrow, the sky will still be above my head. Everybody I think gets my point managing stress is a cliché. But I think what we have to do is really get practical about what am I doing every day with the way I think? And I feel, am I doing things that are in my best interest to keep myself feeling as happy as possible? This is not some Pollyanna type idea. The idea behind this is if I'm really super happy doing things Wendie that are of great service to others, like spending time with you right now, I'm going to win for selfish reasons. I'm going to win. But I'm focusing my attention on helping others and doing the best I can and having a lot of happiness in that. And also knowing with a lot of faith that if I don't finish everything today, it's okay. Say that to myself, that's the way I think that will then transform into the way I feel every day.

Not so stressed out, living with more faith. I would imagine. We spoke off camera that you had a lot of other people speak to this. I could go on and on about it, but I won't. The point is the way we think habitually will then feed into the way we feel. And the way those two things are have a direct impact on how much sugar we burn and then how much sugar we're gonna need. And so I think this is like you say the devil, honestly, when we shed light on this, the devil disappears, the darkness is gone. There is no enemy to fight when you manage your days better. By the way you think and you feel and the way you plan things and the decisions you make and you really focus in on doing more what, you know, deep in your heart and in your mind intuitively however you want to put it, you know exactly what you should be doing.

This is probably the biggest tip of all in reducing sugar cravings and being good to your liver and your, and your kidneys. You know exactly what you need to do. My sleep is off. I'm staying up too late at night, looking at mindless stuff on social media or really grinding out those more of those emails. I've got to get done at 11, 11 30 at night. But our regenerative time is 10 p.m. to two a.m. So, hello, if I'm not in bed those hours, you know, I'm screwing myself. Pardon my French. But the point is all these things that we do, we know if we're right on the money doing things well or we're off and if we don't pay attention to the way we're thinking and feeling more and getting more aligned with what's going to make us think and feel so much better by the habits that we do. Then we're never gonna get over this sugar thing.

We're always gonna be struggling with fatty liver disease. Over 100 million people are suffering with fatty liver disease in the United States alone. He's talking way more than that worldwide, especially in the Western culture from just poor decisions that are being made every day kidney function is going to be breaking down as well. And we all, I would guess on this program, we all understand that the last thing that takes us out in this world, Wendie, for all of us, we can't escape. It is our kidneys will stop functioning and when our kidneys stop games, right? So unless we get hit by an accident, you know, God forbid a car accident or gunshot or something, but the

point is kidney function shuts down and all those poisons build up and that's what takes us out of this world. So taking better care of our liver and kidney function all the days of our life. So important by how we think and we feel and do some of these habits really, really been valuable for me and I hope for a lot more people out there.

Wendie Trubow, MD, MBA, IFMCP

Yeah, Jonathan, this has been amazing and I think we've scratched the surface. We didn't even get to have the things we said we would talk about. So it just really shows how much there is to dive into this. I know people are gonna want to find you. What's the best way for them to get in touch. Find you follow you

Jonathan Landsman

Just go to naturalhealth365.com. You can enter your first name and email address there will be a part of our newsletter community and learn a lot about the things we've talked about. Plus so much more and be able to interact with each other.

Wendie Trubow, MD, MBA, IFMCP

This is amazing. Jonathan. Thank you. Thank you for being part of the summit and for talking to me today, we'll close this out. Thanks to listeners for listening to another episode of the Environmental Toxicants, Autoimmunity and Chronic Diseases Summit. Our guest today is Jonathan Landsman. Thank you for being here.
